

The first milestone: To reduce our CO₂ emissions by 50%

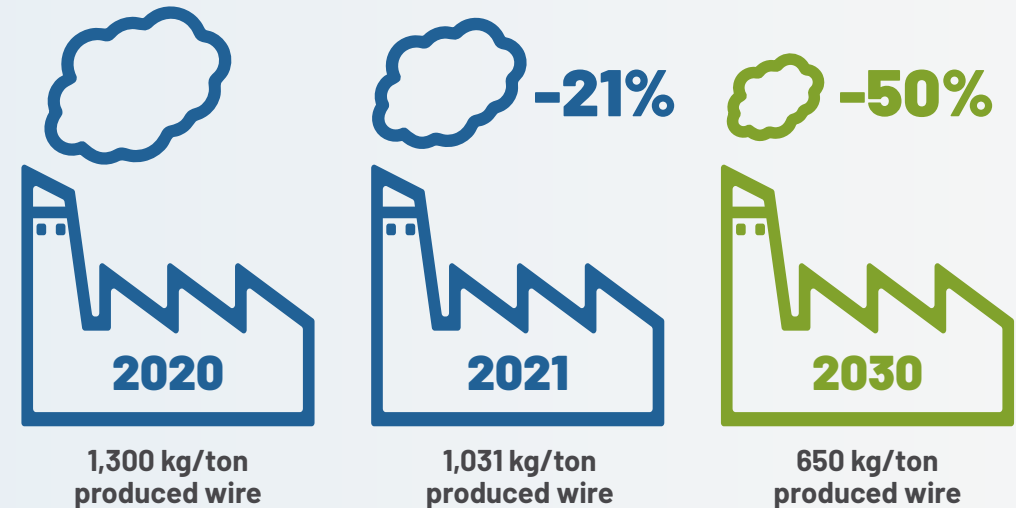

Our products are made from 100% recyclable steel, which is great. But we must reduce the environmental impact of our production. In 2020, our CO₂ emissions were 1,300 kg per ton of wire produced. By 2030, this will be reduced by half. Least. And it's only the beginning.

We are well on our way. Last year, in 2021, our CO₂ emissions were reduced by 21 percent.

Suzuki Garphyttan is a global company with production facilities worldwide. We work intensively to reach our emission target and to develop our business to further strengthen our position in the steel industry.

Right now, we are developing our facilities and **reducing our common energy consumption** by switching to green power and solar panels. In addition, we are moving to **more sustainable production methods**, like shot blasting, contributing to a more efficient use of our raw material.

Reduced CO₂ emissions

Heading for a sustainable tomorrow

Sustainability is an important driving force for us. We strive for a better tomorrow and push the boundaries for sustainable development. This includes finding new applications for our 100 percent recyclable steel products.

Our environmental targets are constantly high on the agenda. Right now, we are focusing on reduced CO₂

emissions, increased recycling volumes and removing non-environmentally friendly elements from our production. We also care about giving everyone in our company the best possible chance to develop, grow and love their job.

With tailored solutions and a global presence, we provide strength and reliability to our company, our customers and our industry. Today and tomorrow.
